Nature's Dangerous Decline 'Unprecedented' Species Extinction Rates 'Accelerating'

Current global response insufficient; 'Transformative changes' needed to restore and protect nature: Opposition from vested interests can be overcome for public good

> Most comprehensive assessment of its kind; 1,000,000 species threatened with extinction

Mr. Trump, angry that China is retreating from its commitments just as the sides appeared to be nearing a deal and confident the American economy can handle a continuation of the trade war, will increase tariffs on \$200 billion worth of Chinese goods on Friday morning, his top advisers said.

in biodiversity across the and the dangers that creates for human civilization. A summary of its findings, which was approved by representatives from the United States and 131 other coun-tries, was released Monday in Paris. The full report is set to be published this year.

Its conclusions are stark. In most major land habitats, from

biotic homogenization

Landscape homogenization

Biodiversity monitoring is critical to understand how to mitigate mass extinction

- Biodiversity is multidimensional
- There is no unique indicator to describe or monitor biodiversity
- →Group on Earth Observations Biodiversity Observation Network (GEO BON) aims at improving the availability of biodiversity change data to decision makers and scientists in support of policy

A global system of harmonized observations is needed to inform scientists and policy-makers.

Remote sensing as a key data source for biodiversity monitoring

Earth observation appropriate to provide information for the monitoring of biodiversity

'RS enabled EBVs'

- Regional / global monitoring
- Cost effective
- Coupling with global modeling tools
- Combined with in situ observation networks

Very active domain of research, boosted by increased RS data availibility (including LandSat & Copernicus)

monitoring strategy, say Andrew K. Skidmore, Nathalie Pettorelli and colleagues.

Ecologists and space agencies must forge a global

Essential Biodiversity Variables

They provide the first level of abstraction between low-level primary observations and highlevel indicators of biodiversity

An ideal EBV should be able to

- capture critical scales and dimensions of biodiversity
- a state variable (in general) sensitive to change
- ecosystem agnostic (to the degree possible)
- technically feasible economically viable sustainable in time

Global methodology to define essential biodiversity variables (based on Skidmore et al., 2015)

- We demonstrated that it is possible to derive key parameters required to develop a set of the EBV's from remote sensing data (RS).
- The joint use of remote sensing data sources with various spatial, temporal and spectral resolutions is essential for accessing the different descriptors of natural habitats.

Influence of environmental factors on species composition

Spatially exhaustive maps of biodiversity allows linking different components of biodiversity to multiple factors

- Terrain: elevation, slope, orientation
- Hydrology
- Geological & edaphic context
- Various human induced effects

Imaging spectroscopy is powerful, yet complex to (pre) process and quite costly

Details about the site: Asner & Martin, 2011 (New Phytol.)

Operationalization of Biodiversity mapping with satellite data

- Other types of data may be considered for application of methods for diversity mapping based on spectral heterogeneity, but further studies required
 - Very high spatial resolution multispectral sensors
 - Worldview
 - LandSat-8
 - Sentinel-2 To be explored if interested in regional scale
 - Other types of data
 - LiDAR: structural heterogeneity
 - Radar

Gill, M., Jongman, R., Luque, S., Mora, B., Paganini, M., Szantoi, Z. (Eds.) 2017

Over-arching research goals RS-EBV's

- □ Innovation & technology for improved biodiversity monitoring
- □ Higher landscape heterogeneity (derived from RS) is related to higher amount of species occupying different niches
- Operational method to improve biodiversity monitoring despite assumptions
- Operational methods & tools to be linked to policies for improvement of public awareness and cost-effective management of biodiversity
