

# Forland Restoration

Anticipate. Decide. Monitor.

A tool to implement participative landscape restoration

Climate-KIC is supported by the EIT, a body of the European Union

# QUIZZ

## What is Forest Landscape Restoration for you ?

Answer the quizz and let's see how you ... and ... others see the FLR

**Defend your point of view after the results of the quizz !**

# Forest Landscape Restoration

**BONN  
CHALLENGE**

**150 M ha by 2020  
350 M ha by 2030**

**afr100**

**Initiative  
20x20**

New York Declaration on Forests

**GLOBAL PLATFORM**

- halving tropical deforestation by 2020 and ending it by 2030.
- calling for the restoration of 150 million hectares of degraded landscapes and forestlands by 2020 and 350 million hectares by 2030.

**It is time for implementation**

# Forland Restoration Vision and Principles

**Our Vision:** People can better adapt to radical change and their decisions are more sustainable when they can explore TOGETHER possible futures and reflect different point of view.

**Collaborative:** building a common vision of a landscape making every voice count

**Innovative:** building a Forland Restoration platform for your landscape

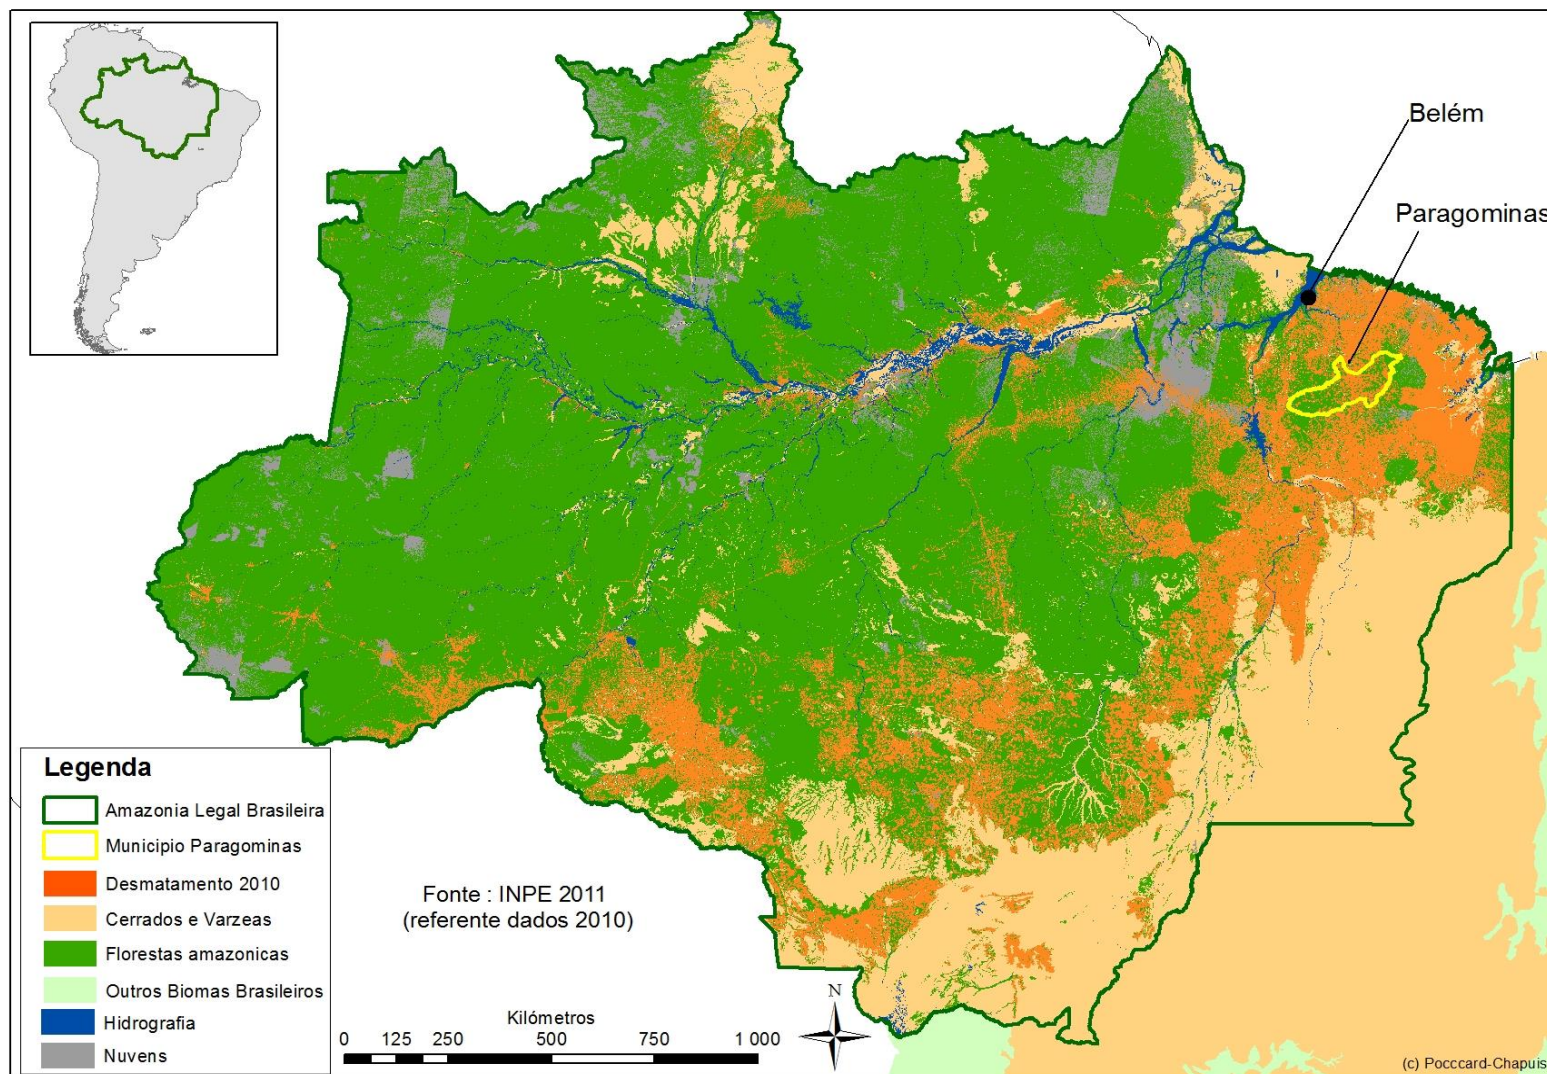

**Prospective:** building and assessing the impact of scenarios for Decision

# Paragominas in The Brazilian Amazon

iufro2019  
Curitiba · Brazil

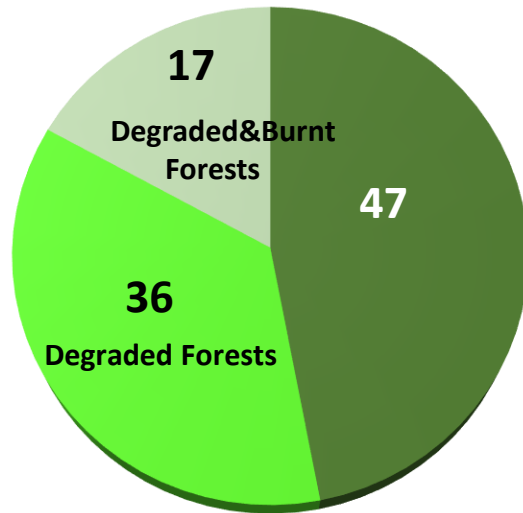

# Case Study : Paragominas municipality, Brazil

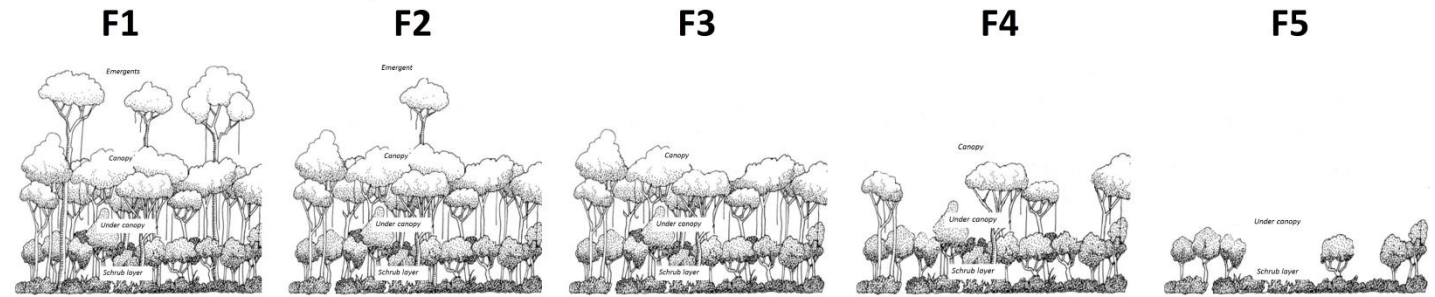

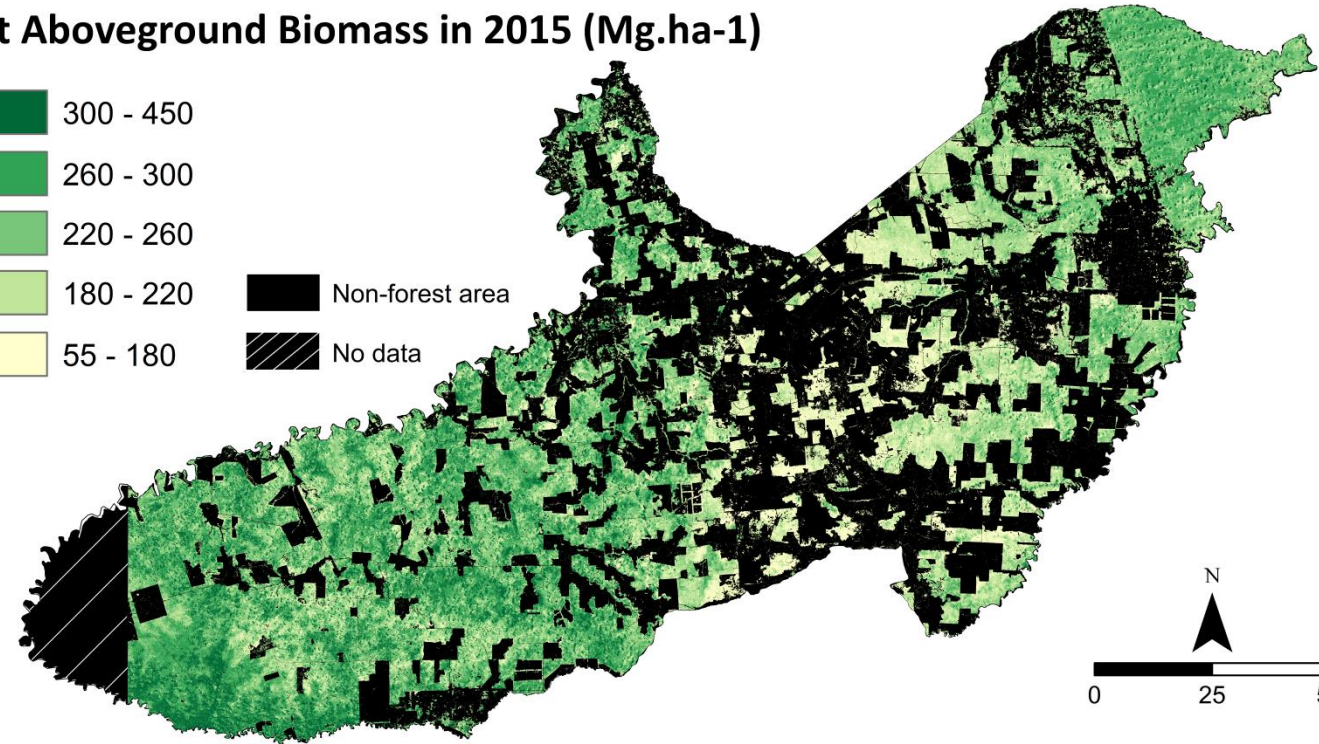

- ❖ 19,342 km<sup>2</sup>, 100,000 inhabitants
- ❖ The city was built in 1961, at the early colonization period of the Brazilian Amazon
- ❖ High deforestation rates in the past for cattle ranching
- ❖ Since 2008 , Paragominas has moved to a green municipality approach and is now committed to a green economy plan.
- ❖ A clear demand from the territorial governance (Municipality) to move forward deforestation control actions

# Forest Cover

Forest Cover = 60 %  
(1,140,000 ha)

Forest Aboveground Biomass in 2015 (Mg.ha<sup>-1</sup>)

## General Landscape View of Paragominas

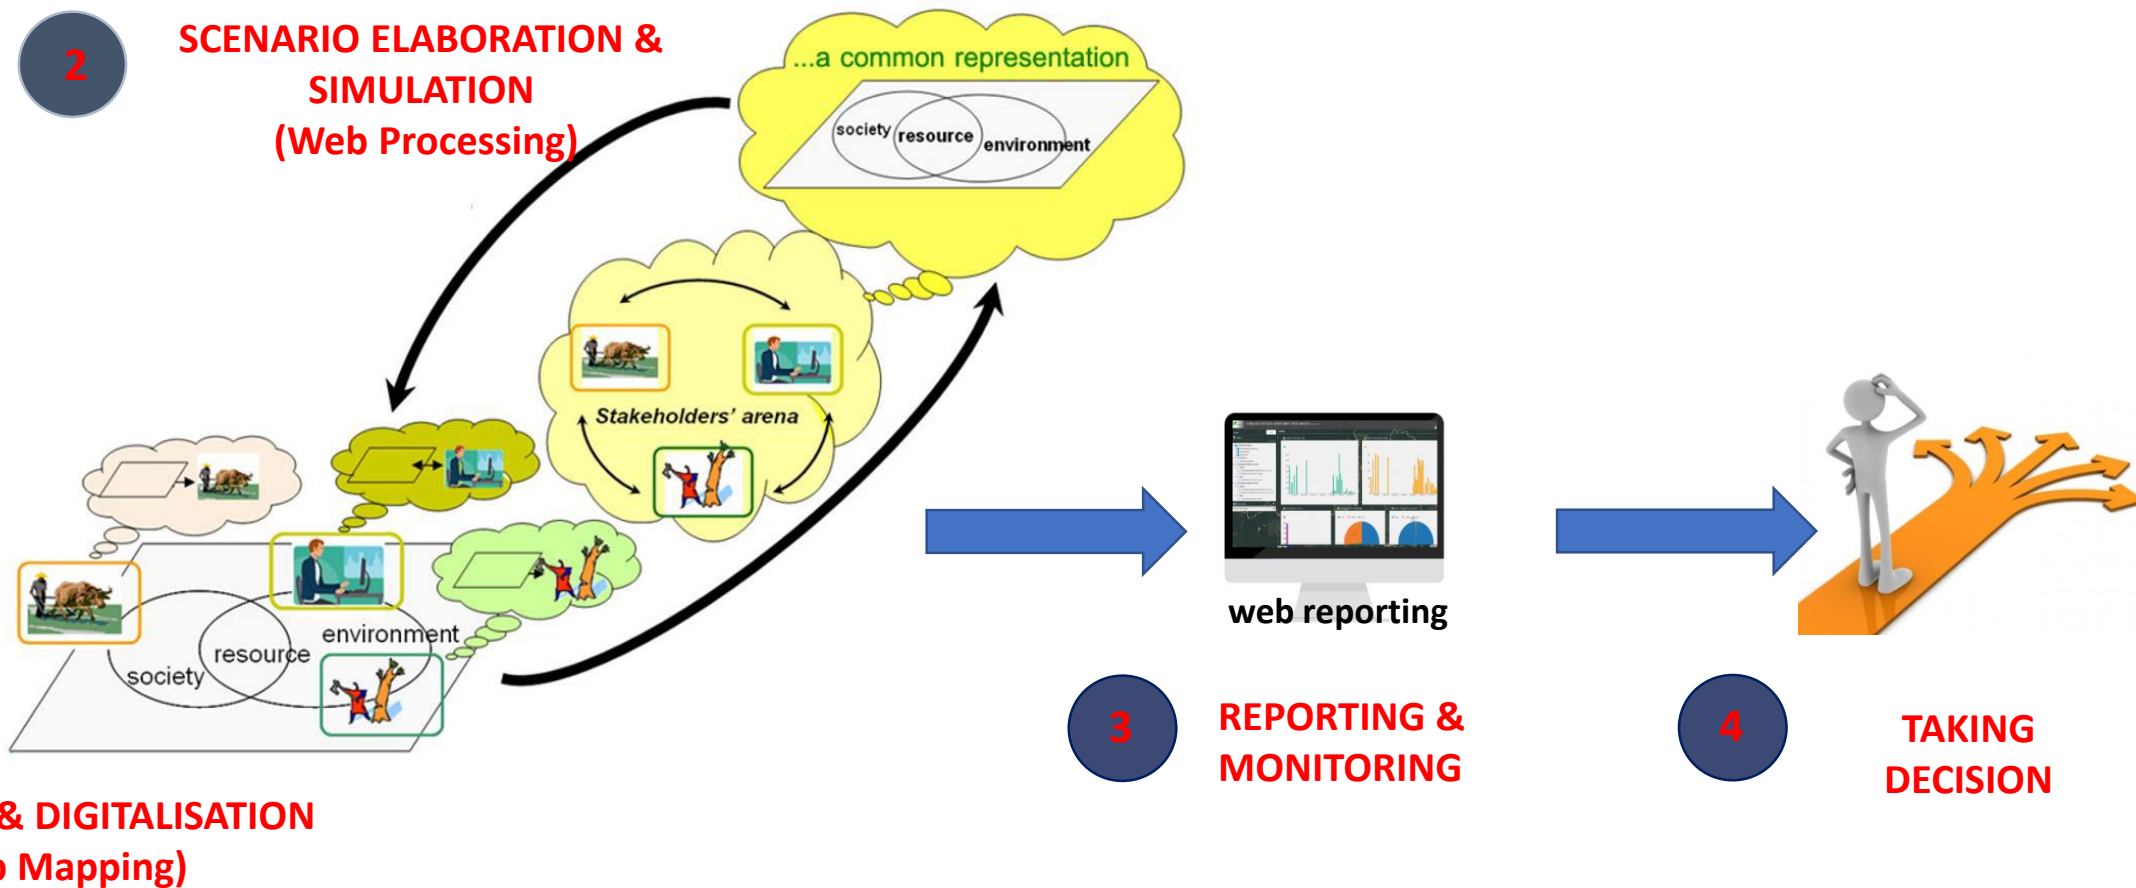

Finding the best land-use compromise for the best landscape ecological functioning  
Forest cover quality, forest connectivity, forest production

# How does it work?

# Defining indicators

## Indicators discussed with stakeholders

### Slope (%)

Sun Radiation

Precipitation (mm/yr)

Distribuição da precipitação

Temperature min/ max (°C)

### Forest Cover (ha)

Fires (% landscape/farms)

Biodiversity (fauna, flora)

Forest Quality

Type of Forest

Rivers (volume)

Soil quality (nutrients)

Air Quality

Water quality

Carbon Balance

Wind

Fragmentation

## Ecological Indicators

- Carbon
- Erosion
- Connectivity (forests species & generalists)

Merged Indicators

## Social and Economic Indicators

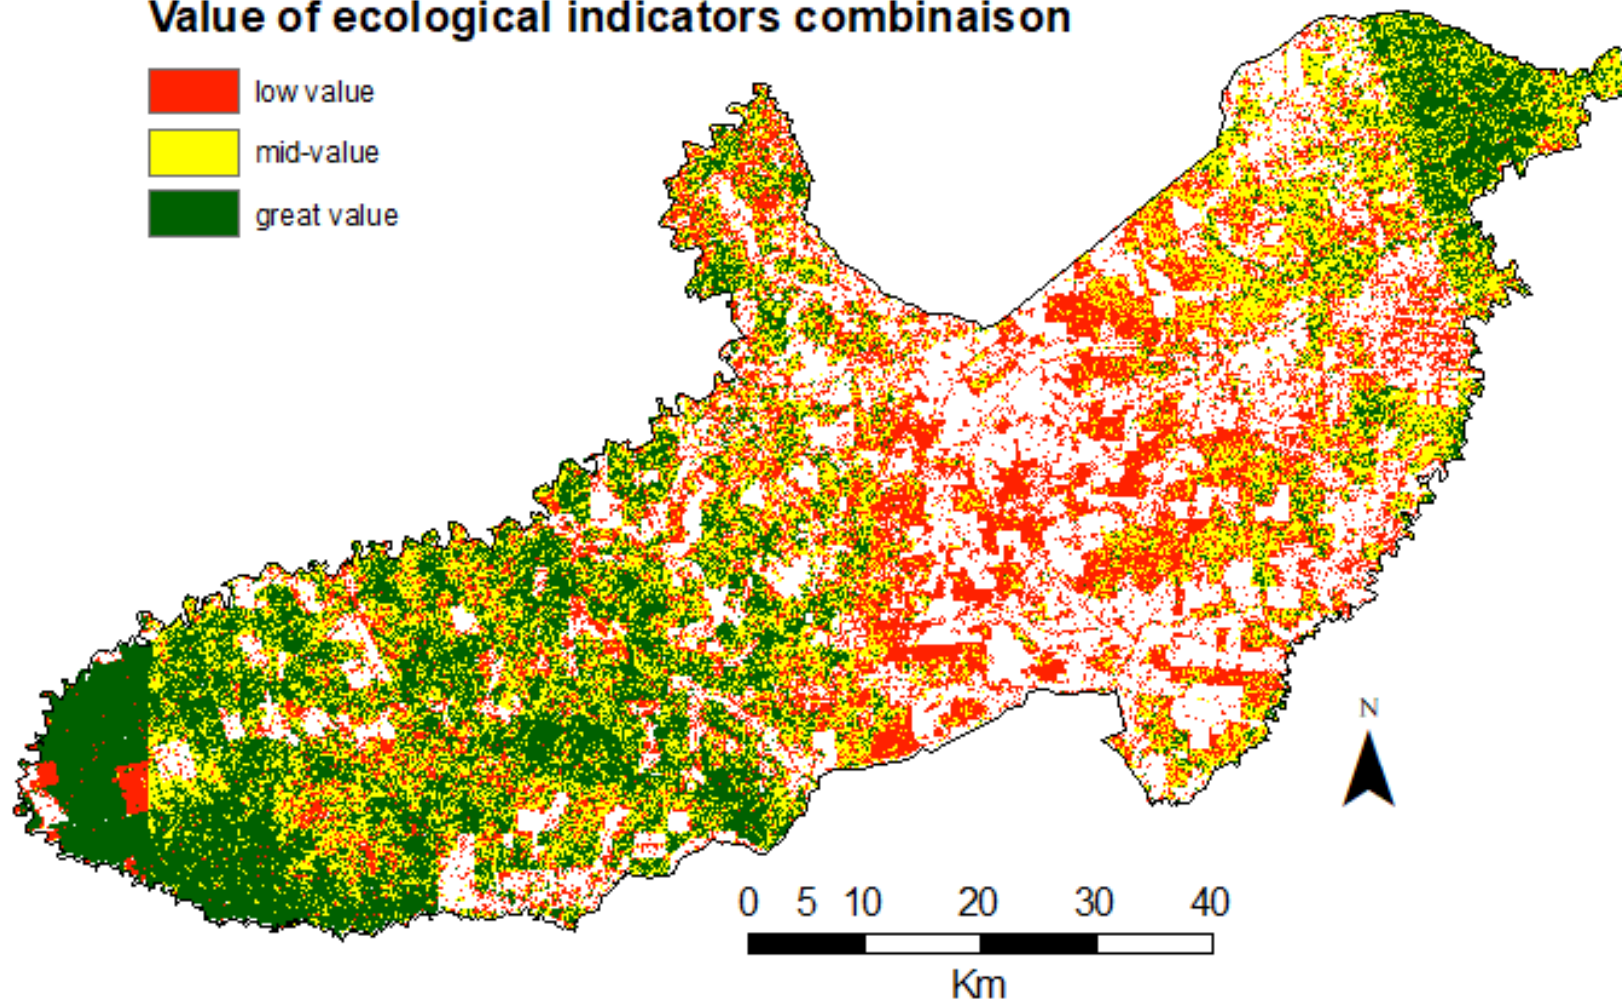

- Costs and Benefits of land use systems
- Jobs
- Land Use Value

# Map of the Merged Environmental Indicators

## Value of ecological indicators combinaison

# Decision Making

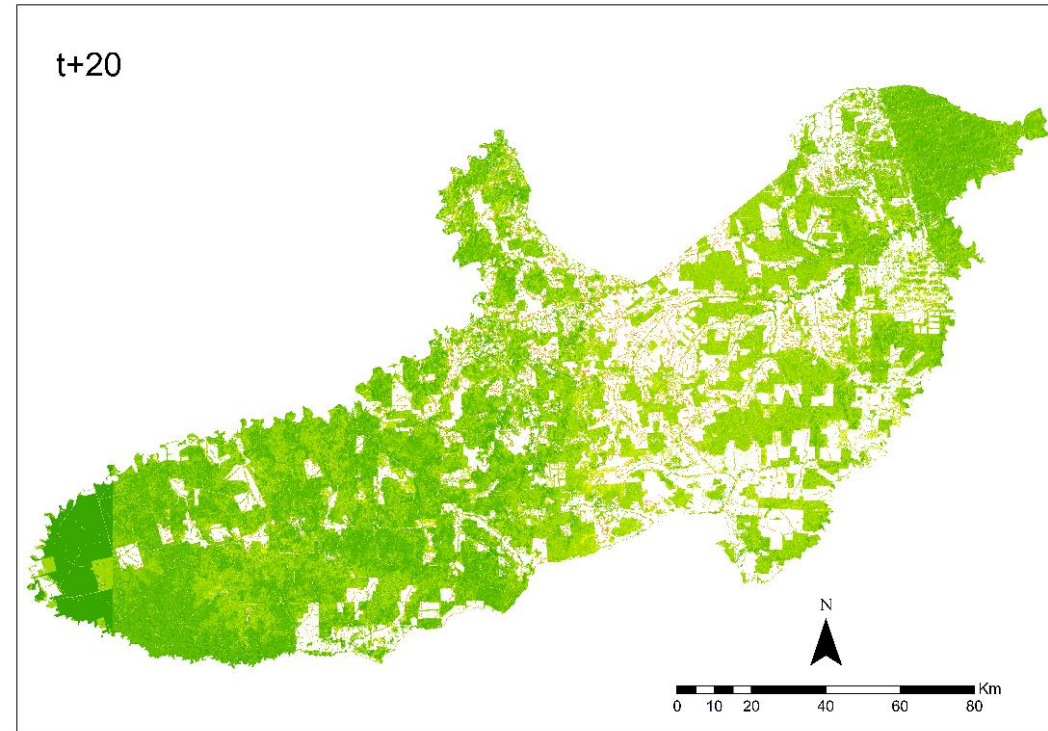

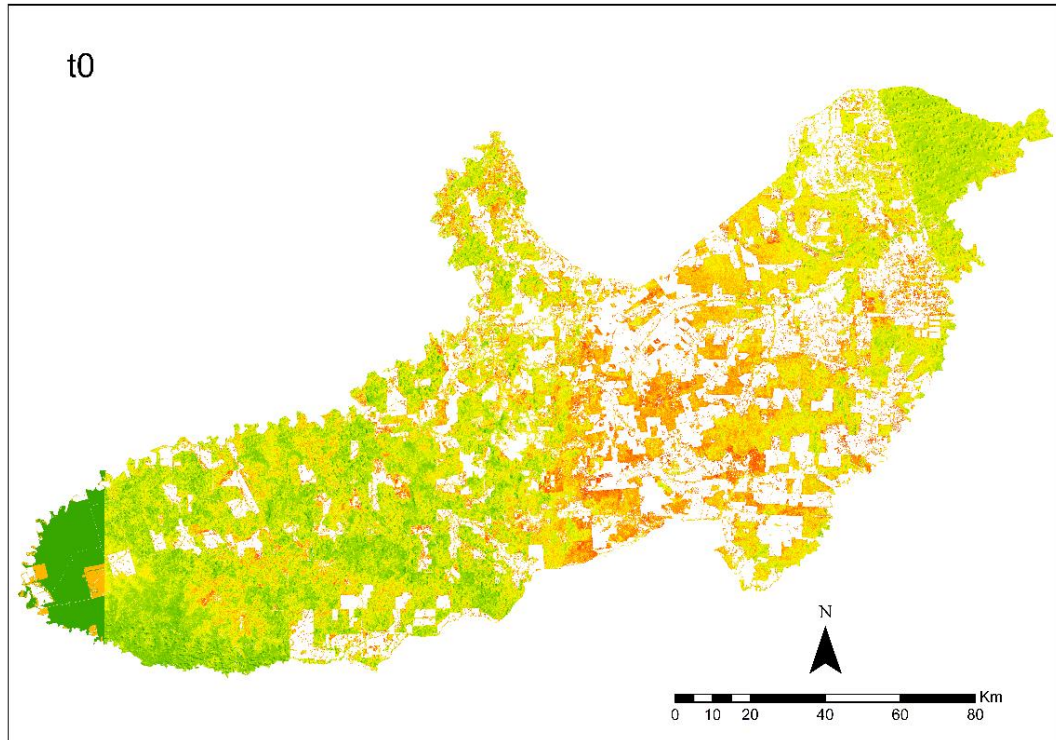

# Building Scenarios (5, 10, 30 years)

- **BAU** : land use stay constant over the years, projection of the degradation model (estimated on 2008-2017) on the forested areas, knowing that we do not have secondary forests dynamics models (= abandoned pastures) and growth model (from Poorter et al. 2017)
- **Optimal** : law (**without** degradation) : natural regeneration or plantation (**done**)
- **Landscape Redesign** : land use change according « aptitudes x degradation x suitability » :
  - Natural regeneration (or plantations) in APP and slopes (> %)
  - Convert « highly degraded forest » to productions (soybean/beef...)
    - ➡ rules respected by 100 % the land-owners
    - ➡ definition of *highly degraded forest (based on ES)*
    - ➡ ratio of land-use “exchange”, 1-x ratio means 1 area unit of restored land for x unit of deforested land

# Carbon Stock In the Optimal Scenario

iufro2019  
Curitiba • Brazil

# Carbon stocks

2037

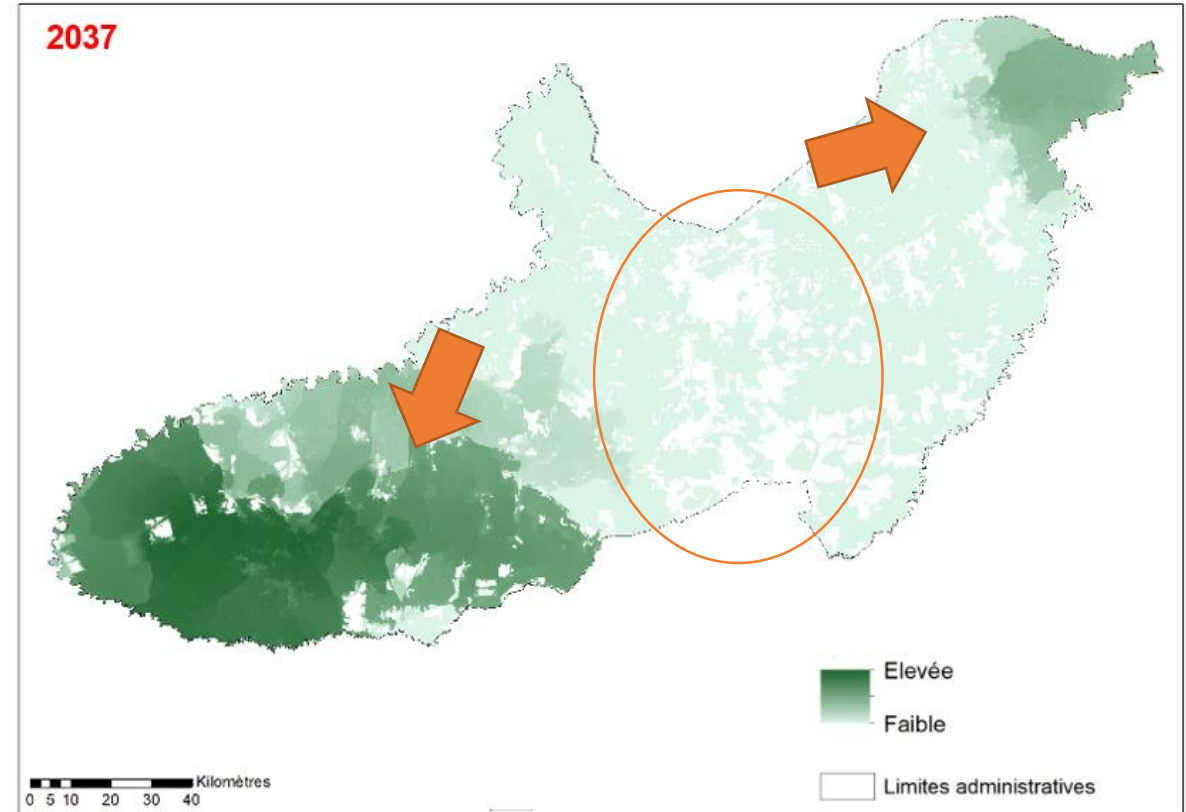

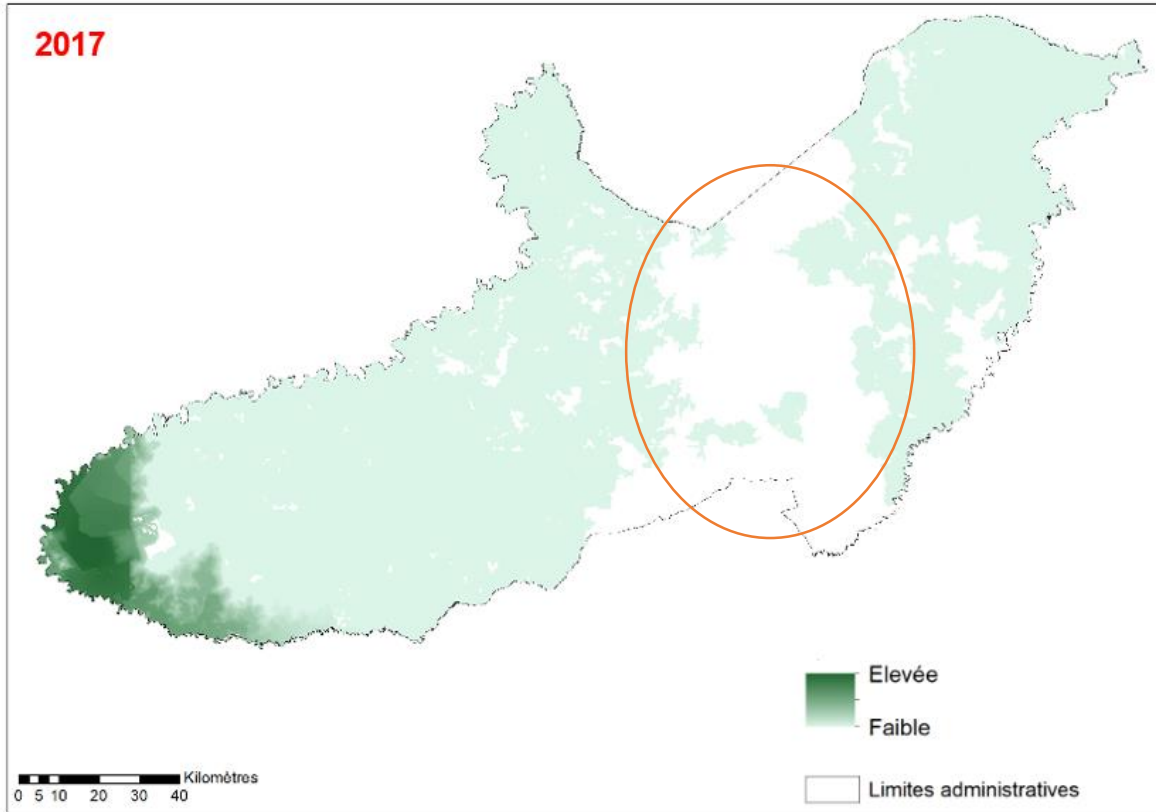

2067

# Connectivity maps : optimal scenario

## Forest mammals with low mobility capacity

- Increased connectivity potential at the western and eastern extremities of the territory Effect of stopping degradation
- Central corridor still poorly connected despite reforestation of APPs

iufro2019  
Curitiba • Brazil

# Conclusions

- ❖ Bottom up Approach = Demand of the Municipality
- ❖ Participative Approach = Consensus among stakeholders  
Every voice counts
- ❖ Towards a Common Vision of the Territory
